in this work the authors present a global perspective on the methods available for analysis and design of non linear control systems and detail specific applications they provide a tutorial exposition of the major non linear systems analysis techniques followed by a discussion of available non linear design methods

this book contains the text of the plenary lectures and the mini courses of the european control conference ecc 93 held in groningen the netherlands june 2s july 1 1993 however the book is not your usual conference proceedings instead the authors took this occasion to take a broad overview of the field of control and discuss its development both from a theoretical as well as from an engineering perspective the first essay is by the key note speaker of the conference a g j mac farlane it consists of a non technical discussion of information processing and knowledge acquisition as the key features of control engineering technology the next six articles are accounts of the plenary addresses the contribution by r w brockett concerns a mathematical framework for modelling motion control a central question in robotics and vision in the paper by m morari the engineering and the economic relevance of chemical process control are considered in particular statistical quality control and the control of systems with constraints the article by a c p m backx is written from an industrial perspective the author is director of an engineering consulting firm involved in the design of industrial control equipment specifically the possibility of obtaining high performance and reliable controllers by modelling identification and optimizing industrial processes is discussed

leading academic and industrial researchers working with adaptive systems and signal processing have been given the opportunity to exchange ideas concepts and solutions at the ifac symposia on adaptive systems in control and signal processing this postprint volume contains all those papers which were presented at the 5th ifac symposium in budapest in 1995 the technical program was composed of a

number of invited and contributed sessions and a special case study session providing a good balance between applications and theory oriented papers

august 8 12 1994 brighton england from animals to animats 3 brings together research intended to advance the front tier of an exciting new approach to understanding intelligence the contributors represent a broad range of interests from artificial intelligence and robotics to ethology and the neurosciences unifying these approaches is the notion of animat an artificial animal either simulated by a computer or embodied in a robot which must survive and adapt in progressively more challenging environments the 58 contributions focus particularly on well defined models computer simulations and built robots in order to help characterize and compare various principles and architectures capable of inducing adaptive behavior in real or artificial animals topics include individual and collective behavior neural correlates of behavior perception and motor control motivation and emotion action selection and behavioral sequences ontogeny learning and evolution internal world models and cognitive processes applied adaptive behavior autonomous robots hierarchical and parallel organizations emergent structures and behaviors problem solving and planning goal directed behavior neural networks and evolutionary computation characterization of environments a bradford book

the field of intelligent control has recently emerged as a response to the challenge of controlling highly complex and uncertain nonlinear systems it attempts to endow the controller with the key properties of adaptation learning and autonomy the field is still immature and there exists a wide scope for the development of new methods that enhance the key properties of intelligent systems and improve the

performance in the face of increasingly complex or uncertain conditions the work reported in this book represents a step in this direction a number of original neural network based adaptive control designs are introduced for dealing with plants characterized by unknown functions nonlinearity multimodal behaviour randomness and disturbances the proposed schemes achieve high levels of performance by enhancing the controller's capability for adaptation stabilization management of uncertainty and learning both deterministic and stochastic plants are considered in the deterministic case implementation stability and convergence issues are addressed from the perspective of lyapunov theory when compared with other schemes the methods presented lead to more efficient use of computational storage and improved adaptation for continuous time systems and more global stability results with less prior knowledge in discrete time systems

this elementary book provides some state of the art research results on broad disciplinary sciences on complex networks it presents an in depth study with detailed description of dynamics controls and applications of complex networks the contents of this book can be summarized as follows first the dynamics of complex networks for example the cluster dynamic analysis by using kernel spectral methods community detection algorithms in bipartite networks epidemiological modeling with demographics and epidemic spreading on multi layer networks are studied second the controls of complex networks are investigated including topics like distributed finite time cooperative control of multi agent systems by applying homogenous degree and lyapunov methods composite finite time containment control for disturbed second order multi agent systems fractional order observer design of multi agent systems chaos control and anticontrol of complex systems via parrondos game and many more third the applications of complex networks provide some applicable carriers which show the importance of theories developed in complex networks in particular a general model for studying time evolution of transition networks deflection routing in complex networks recommender systems for social networks analysis and mining strategy selection in networked evolutionary games integration and methods in computational biology are discussed in detail
